

Personal Time Management.

Overview

User picks a day and puts activities and their durations. User can pick activities from few categories:

- Play
- Work
- Sleep

Each day is represented by a pie chart showing values of all categories and their values.

Details

Application uses MySQL as persistence layer. Zendframework 2 with its MVC modules as basis for frontend which communicates with RPC server with encapsulated business logic.

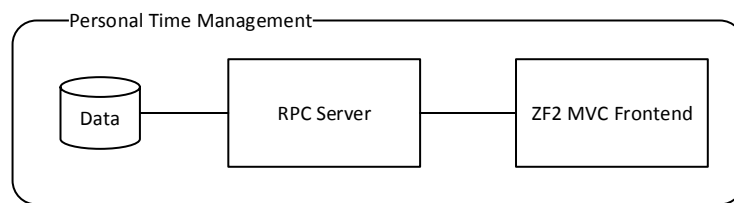

Figure 1. Personal Time Management components.

Libraries used:

- Simplon_jr for RPC server.
- Simplon_form for form handling.
- Simplon_config for configuration of the rpc server.
- Simplon_db for managing database connection and queries.

Business entity is Day object. Full date in format DD-MM-YYYY is the ID of the object and row in the database. Other entities are Activity and Category. The latest is the type of the activity that user may pick while logging time into Personal Time Management. Activity itself is composed of Category and duration in hours. Each Day may have multiple Activities but each Activity can be mapped only to one Day.
